Which listings grabber are you using? If you run mythtv-setup from cmd line what did the log show?

I have tried the North America (SchedulesDirect.org) (Internal) with good creds and Retreive Listings pulls in the Direct Data Lineup correctly.

Thanks for looking into this issue.

I noticed this issue on a fresh install only using the legacy grabber(Internal) from schedules direct.
I confirmed that the internet could be reached.
I did not run from the cmd line, but i can if i set up a fresh new install. I replaced the mythconverg database from a backup which contained my credentials already and is working fine.

I tested the new schedules direct service json api. That worked fine with my credentials.
Thanks for cleaning up the issue details.

I have tried this now in a VM and 2 physical boxes with R8.5.2 clean installs with North America (SchedulesDirect.org) (Internal) and it pulls in my listings every time. Are you sure you have listings setup on the SD website?
