| Updated: | 03/20/2010 | Due date: | 12/31/1969 |
| Description: | If /myth is not able to be mounted on upgrade to R6 (i.e because it's on a software raid) a restore will fail. Per discussion with jams, maybe we can add logic to look for the tar/gz files somewhere in /. | | |

History

12/14/2008 10:53 am - jams

If /myth/backup/mythconverg.sql.gz is not present it will use the file located in /root/backup.

Before upgrade /root/backup/mythconverg.sql.gz is copied out to avoid it being lost during the format.
