<b>Description:</b>	Hi ...  I figured out some problems with password settings ... or have I forgotten or overseen something.  Maybe it is not really difficult, but I have installed a new system using 7.00.03 Beta image. I setup my machine as Masterbackend running a frontend.  Setting up a new user with password ... why is there no must for setting a password for root user? Later it is not possible to "su" because of missing root password. Ok tried manually to set one up with linhes install boot CD works, but some trouble we could miss.

If you don't assign a root password at install the password will be blank and root can be accessed only from the console. The [\[\[Install\\_LinHES\]\]](#) page has been updated to reflect this.
