| Description: | The package for APC UPS daemon is not in the R8 repository. I was able to install the package by manually downloading it from the Arch repository and install it with Pacman. However, I had to manually copy some files from a 7.4 backup and create a symlink in order to add the service. Details are in the following post: http://forums.linhes.org/viewtopic.php?f=21&t=23889 The version I installed is: apcupsd 3.14.10 (13 September 2011) unknown I would be happy to provide more information and try to help if possible. | | |
